**ABSTRACT**

Introduction;

Rapid urbanization in Kenya has resulted in growth of slums in urban centres, characterised by poverty, inadequate social services and poor health outcomes. The government's initiatives to improve access to quality health care for mothers and children are largely limited to public health facilities which are few and/or inaccessible in underserved areas like the slums. The 'Partnership for Maternal, Newborn and Child Health' (PAMANECH) project is being implemented in two Nairobi slums, Viwandani and Korogocho to assess the impact of strengthening public-private partnerships for the delivery of health care on the health of mothers, newborns and young children in two informal settlements in Kenya.

Methods and analysis;

A quasi-experimental study. Our approach is to support both private and public health providers and the community to enhance access to, and demand for quality health care services. Key activities include; infrastructural upgrade of selected Private Not-For-Profit health facilities operating in the two slums, building capacity for both health care providers and the Health Management Teams in Nairobi, facilitating provision of supportive supervision by the local health authorities and forming networks of Community Health Volunteers (CHVs) to create demand for the health services. To assess the impact of the intervention, the study is utilising multiple data sources using a combination of qualitative and quantitative methods. A baseline survey was conducted in 2013 and an end line survey will be conducted at least one year after full implementation of the intervention. Systematic monitoring and documentation of the intervention is on-going to strengthen the case for causal inference.

Ethics and dissemination.

Ethical approval for the study was obtained from the Kenya Medical Research Institute. Key messages from the results will be packaged and widely disseminated through workshops, conference presentations, reports, factsheets and academic publications to facilitate uptake by policy makers.

**UNITS OF ANALYSIS**

Women of reproductive age and children under-five years

### Scope

---

**NOTES**

The scope of the baseline survey was as follows ;

1. Care seeking practices for childhood illness, child death and preventive services such as vaccination for children.
2. Care seeking practices for women of reproductive age for preventive and curative services including family planning,

antenatal care, delivery, pregnancy outcomes, postnatal care , referral services

3. Breast feeding practices including initiation of breastfeeding within an hour of birth, exclusive breastfeeding and introduction of complimentary feeds
4. Referral patterns (frequency, timing and success rate) for obstetric and childhood illness emergencies
5. Knowledge of sexual transmitted infections
6. Quality and attitude towards health care services
7. Male involvement in maternal and child health
8. Interactions with Community Health Workers

## KEYWORDS

Public-Private Partnerships, Maternal, Newborn, Child Health, Slums, Kenya

## Coverage

---

### GEOGRAPHIC COVERAGE

Two Nairobi urban slums Korogocho and Viwandani

### UNIVERSE

The direct beneficiaries of the project are women of reproductive age and children under the age of five years in the two informal settlements who make up 20% and 14% of the population, respectively. In addition, five health facilities are being upgraded and the health care providers in the selected PNFP and other public and private health facilities benefitting from training and skills upgrade. CHVs, the sCHMTs of the two sub-Counties where the study sites are located as well as the Nairobi County Health Management leadership are other direct beneficiaries. Residents of areas outside the NUDHSS as well as residents of the two slums who are male and/or older than 5 years but less than 15 years and/or older than 50 years are the indirect beneficiaries.

# Sampling

## Sampling Procedure

---

Sampling procedure was for primary units. Random numbers were generated to select women of reproductive age (12 to 49 years) and children under 5 years from the most up-to-date Nairobi Urban Health and Demographic Surveillance System (NUHDSS) database. The sampling frame was restricted to those households that have individuals within the two study populations.

## Deviations from Sample Design

---

None

## Response Rate

---

Total number of women interviewed were 849  
Total number of interviews for children under 5 years were 975  
Response rate: 100%

## Weighting

---

No weighting

# Questionnaires

## Overview

---

The women questionnaire was administered to women aged 12 - 49. The questionnaire included;

- Respondents background characteristics
- Care seeking behavior -Family planning services and knowledge, Ante Natal Care, Delivery, Post- Natal Care,
- Referral patterns
- Quality of health care facilities and interaction with Community Health Workers
- Child morbidity and Mortality
- Breastfeeding - Early initiation, breastfeeding knowledge, attitude and practice
- HIV and AIDs, and other STIs

The child questionnaire was for children under 5 years age and it was administered to parents or guardians of the children.

This questionnaire included;

- Background characteristics of respondent,
- Care seeking behavior including vaccination,
- Child morbidity and mortality.

Both questionnaires were administered in Kiswahili.

## Data Collection

### Questionnaires

The women questionnaire was administered to women aged 12 - 49. The questionnaire included;

- Respondents background characteristics
- Care seeking behavior -Family planning services and knowledge, Ante Natal Care, Delivery, Post- Natal Care,
- Referral patterns
- Quality of health care facilities and interaction with Community Health Workers
- Child morbidity and Mortality
- Breastfeeding - Early initiation, breastfeeding knowledge, attitude and practice
- HIV and AIDs, and other STIs

The child questionnaire was for children under 5 years age and it was administered to parents or guardians of the children.

This questionnaire included;

- Background characteristics of respondent,
- Care seeking behavior including vaccination,
- Child morbidity and mortality.

Both questionnaires were administered in Kiswahili.

### Supervision

Supervision was done by a supervision team that consisted of the project team research assistants and the field team leaders. Supervision was done in the following way;

#### 1. Spot Checks

The team leaders would conduct spot check for each of the field workers in their team. The checks were done by random selection of completed interviews and during these checks the supervision team would visit the selected households to confirm whether they had been visited and interviewed by the field team. The research assistance would also randomly select completed interviews checks done by the team leaders to confirm that the data collected to confirm the same.

#### 2. Sit ins

Were also done and this involved the supervision teams accompanying the field interviewers and "sitting in" during interviews.

The spot checks and 'sit ins" were done 3 times a week by the team leaders and twice a week by the research assistance.

To minimize errors and also prevent falsification, the team supervisors edited data collected. They only synchronized the completed data, those that had issues to be verified were brought to the attention of the field interviewer and if verification was required the field interviewer would revisit the respondent.

To minimize errors, each team leader had a maximum of 5 field interviewers.

To prevent data lose, data was backed up on the net book and external hard disc, although synchronization had numerous issues and some of our data may have been affected.

## **Data Processing**

### **Data Editing**

---

Data were collected using Netbooks with inbuilt consistency checks and was synced to the central server at the office for back up. Project data analyst performed post-data collection consistency checks and labelling of variables.
